1. Objective

This report builds a descriptive analytics layer over TastyTown's recorded sales transactions to answer four recurring questions that matter for the day-to-day running of a local fast food and beverages outlet:

- What are TastyTown's best-selling menu items, and how does that differ between Fast Food and Beverages?
- How has total revenue trended month over month across the period covered by the data?
- At what time of day is demand concentrated, and does that call for different staffing?
- How dependent is the business on a small number of repeat customers versus a broad base?

Note on Data

Aspect	Details
Source file	Fastfood.csv
Origin	Kaggle — a public data-sharing platform where individuals and organisations publish datasets for analysis and learning purposes
Coverage	1,000 order lines placed at TastyTown, 4 January 2022 – 3 December 2023
Why this dataset	A genuine row-level transaction export rather than a pre-aggregated summary, which allows figures to be computed directly from underlying rows instead of taken on faith
Columns used	order id, item, category, price, quantity, computed amount, date, time slot, payment mode, customer name — mapping directly onto the business questions in Section 1
Reliability check	Because the source is a third-party file rather than TastyTown's own point-of-sale export, Section 2 documents the verification steps taken to confirm the data is internally consistent before any figure is reported from it
What this enables	Genuine descriptive statistics — measures of central tendency, spread, and cross-tabulation — rather than a KPI-card summary alone

2. How This Would Work At Real Scale

Step	What Was Done	Tool Used
1. Structural check	Confirmed 1,000 rows × 10 columns, no missing values in any column, no duplicate order_id values	Excel
2. Consistency check	Verified transaction_amount equals item_price × quantity for every row — zero mismatches found	Excel
3. Type parsing	Parsed the date column into a proper date type to allow monthly aggregation	Excel
4. Aggregation	Grouped transactions by category, item, month, payment mode, time slot, and customer	Excel / Power BI
5. Visualization	Built the charts and tables presented in this report from the aggregated data	Power BI

3. Monthly Sales Trend

Over the 24-month window covered by the dataset, TastyTown sold 8,162 units across 1,000 orders for a combined revenue of ₹2,75,230, but that total was earned very unevenly across the two years. Between January 2022 and March 2023 — fifteen months — the outlet generated ₹2,53,165, or almost 92% of all revenue in the dataset, averaging ₹16,877.67 a month. From April 2023 onward, the remaining nine months brought in only ₹22,065 combined, an average of just ₹2,451.67 a month — a fall of nearly 86% in the average monthly take.

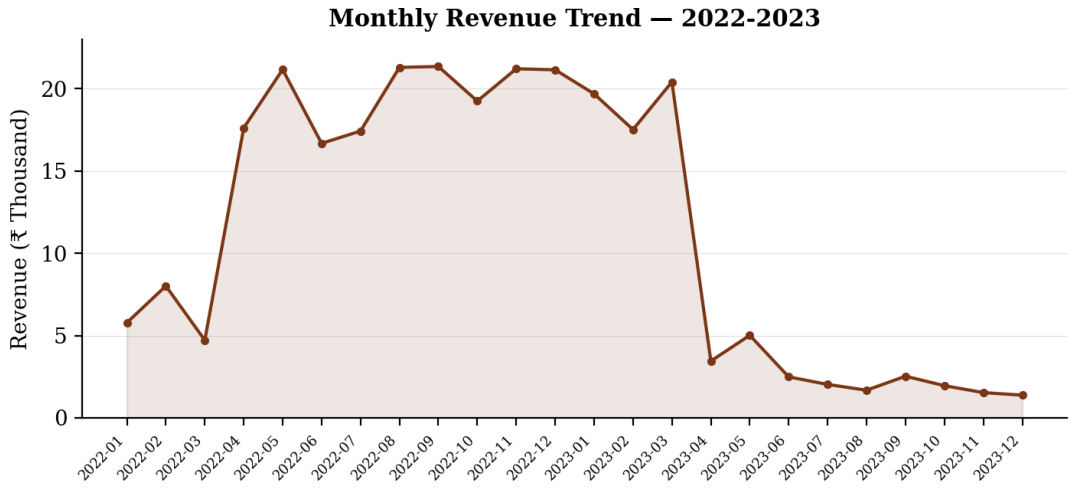

Figure 1. Monthly revenue trend, January 2022 – December 2023 (₹ Thousand).

3.1 KPI Definitions Used

- Monthly revenue = sum of transaction_amount across all order lines recorded in that calendar month.
- Monthly order count = count of order_id values recorded in that calendar month.

3.2 Observations

September 2022 was the single strongest month on record at ₹21,340, closely followed by August 2022 (₹21,285) and November 2022 (₹21,200), while December 2023 was the weakest month in the entire dataset at just ₹1,380. Order counts mirror this pattern almost exactly: the outlet processed between roughly 55 and 85 orders a month through early 2023, but this fell to single digits for most months from April 2023 onward, bottoming out at just four orders in December 2023.

Because the fall shows up identically and simultaneously in both revenue and order count — rather than tapering off gradually, the way a genuine drop in footfall usually would — it looks far more consistent with a break in how orders were being logged than with an actual collapse in customer demand. This is flagged here as the single most important finding to verify against TastyTown's own billing or point-of-sale records before it is treated as a real business decline; the recommendation in Section 9 returns to this directly.

4. Best-Selling Items & Category Performance

TastyTown's menu spans two categories — Fast Food and Beverages — across seven items. Fast Food generated ₹1,88,840 in revenue from 686 order lines and 5,523 units sold, while Beverages generated ₹86,390 from 314 order lines and 2,639 units. Fast Food accounts for roughly 68.6% of total revenue and 67.7% of total units — a two-to-one split that holds almost exactly across both revenue and volume.

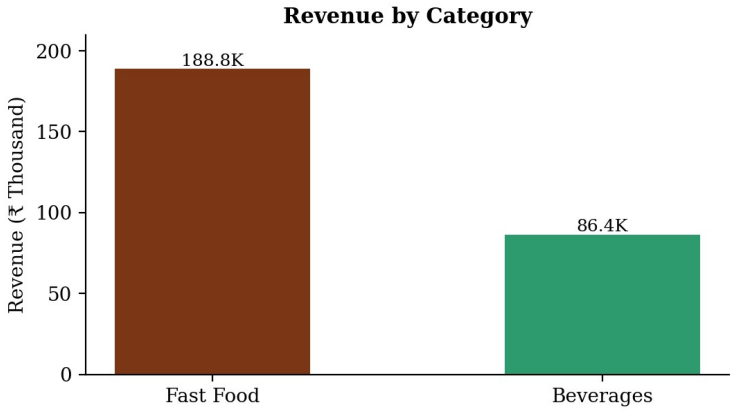

Figure 2. Total revenue by category (₹ Thousand).

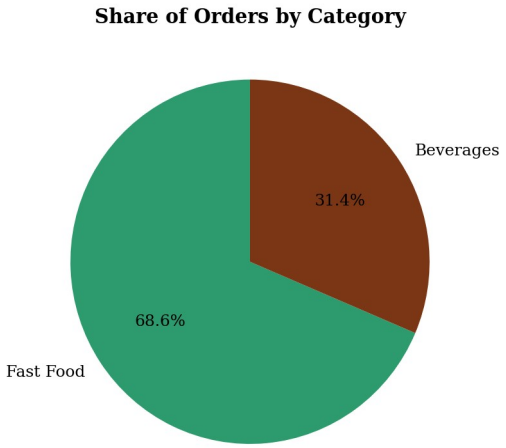

Figure 3. Share of total orders by category.

4.1 Item-Level Ranking

At the individual item level, Sandwich is the clear revenue leader at ₹65,820 from 129 orders, ahead of Frankie (₹57,500 from 139 orders) and Cold coffee (₹54,440 from 161 orders) — the only Beverages item to reach the top three.

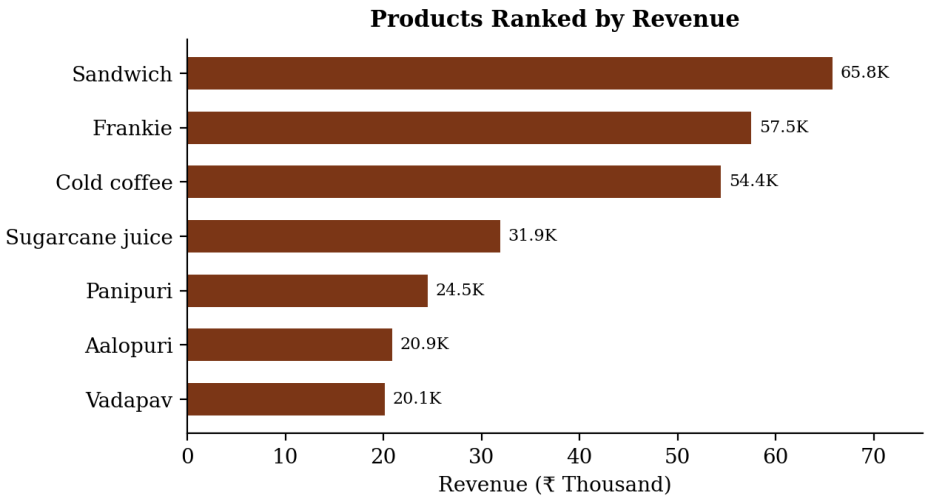

Figure 4. All seven menu items ranked by total revenue (₹ Thousand).

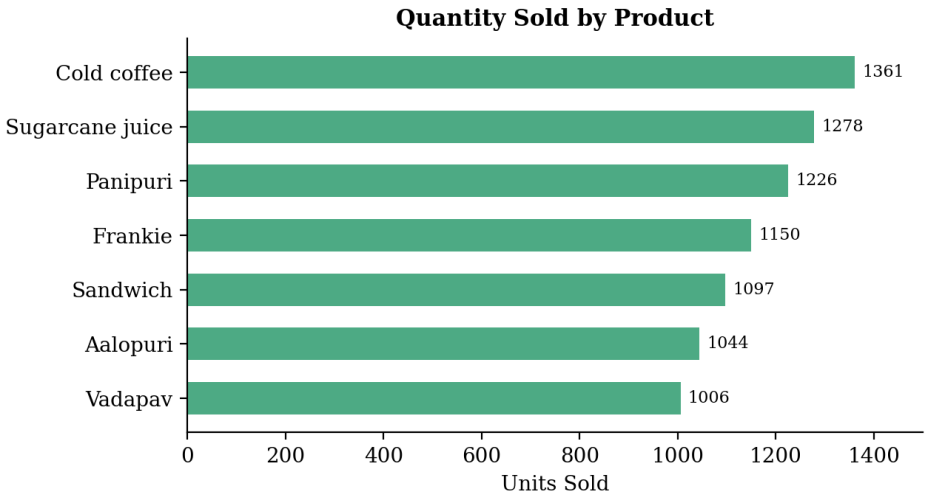

Figure 5. Units sold per menu item.

4.2 Ranking Logic

Items in Figure 4 are ranked by revenue, not units sold, and Figure 5 deliberately shows the units-sold view alongside it because the two rankings disagree in an instructive way. Cold coffee, priced at ₹40, sells the largest number of units of any item (1,361) but finishes only third on revenue, while Sandwich, priced at ₹60 — the highest on the menu — leads on revenue despite ranking fourth on units sold. A high-volume, lower-priced item and a lower-volume, higher-priced item can both look like a "top seller" depending on which lens is used, so stock planning (which cares about units moved) and pricing or promotion decisions (which care about revenue) genuinely need both views side by side rather than a single leaderboard.

4.3 Observations

Vadapav and Aalopuri, the two cheapest items on the menu at ₹20 each, unsurprisingly generate the least revenue even though their order counts are broadly comparable to the rest of the menu. This points toward selective upselling or combo bundling of these lower-priced items with higher-margin ones as a realistic way to lift their contribution without changing what customers already like to order.

5. Payment Method Distribution

Three payment modes appear in the data: Cash, Online, and an Unknown category that most likely reflects transactions where the payment mode was not consistently recorded at the till. Cash is the most common method, used in 476 orders (47.6%) worth ₹1,32,840, followed by Online in 417 orders (41.7%) worth ₹1,10,595. The Unknown category accounts for the remaining 107 orders (10.7%) and ₹31,795 in revenue.

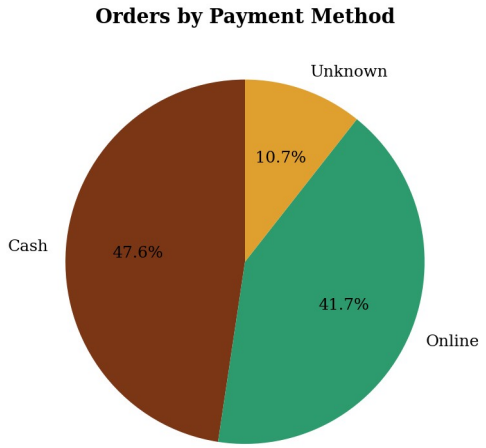

Figure 6. Distribution of orders by payment method.

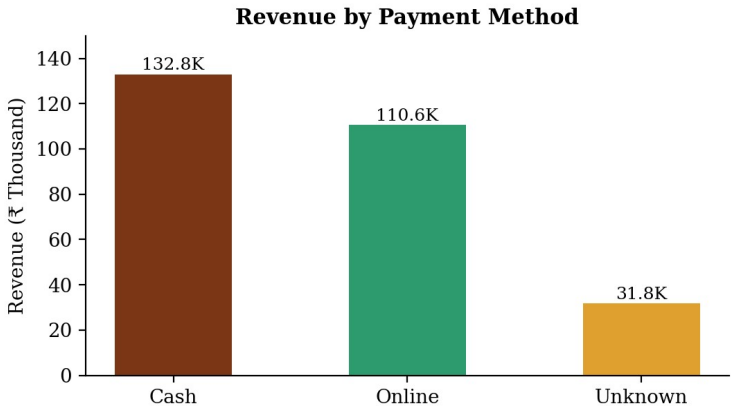

Figure 7. Total revenue by payment method (₹ Thousand).

5.1 Observations

Cash remains the more frequently used method by a modest six-point margin over Online payment — consistent with a local, walk-in fast food counter rather than a fully app-based platform. The Unknown category, at just over one order in ten, is worth fixing at the source: capturing payment mode consistently at the point of sale would sharpen future analysis and clarify whether incentives are needed to grow Online payment.

6. Time-of-Day Demand

Sales are recorded against five time-of-day slots. Night is the busiest period, generating ₹62,075 from 205 orders, narrowly ahead of Afternoon (₹56,345, also 205 orders). Morning, Evening, and Midnight follow closely behind, each contributing between roughly ₹50,000 and ₹54,000.

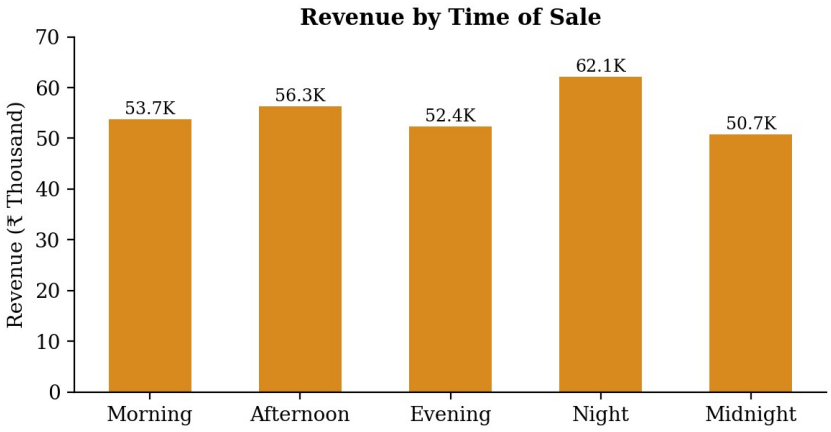

Figure 8. Total revenue by time-of-sale slot (₹ Thousand).

6.1 What This Drives

- Staffing levels through the day, since demand does not fall off sharply outside the Night slot
- Stock and prep planning ahead of the Night and Afternoon windows specifically
- Promotional timing — slower slots like Midnight and Evening are natural candidates for time-boxed offers

6.2 Observations

The spread across all five slots is narrow — no more than about ₹11,000 separates the busiest slot from the quietest — which suggests TastyTown sees fairly steady footfall through the day rather than a single sharply defined rush period. Night's lead is real but modest, and given how closely Afternoon trails it, staffing decisions built primarily around a night-time peak should still leave adequate cover for the afternoon window, which performs almost as strongly.

7. Customer Concentration & Loyalty

The dataset records twelve named customers who between them placed all 1,000 orders, an average of roughly 83 orders each. Mr. Arjun is the most frequent and highest-spending customer, placing 101 orders worth ₹30,620, followed by Mr. Vivek (87 orders, ₹26,510) and Mrs. Diya (89 orders, ₹25,845). At the other end, Mrs. Ananya placed the fewest orders (71) and generated the least revenue (₹19,330).

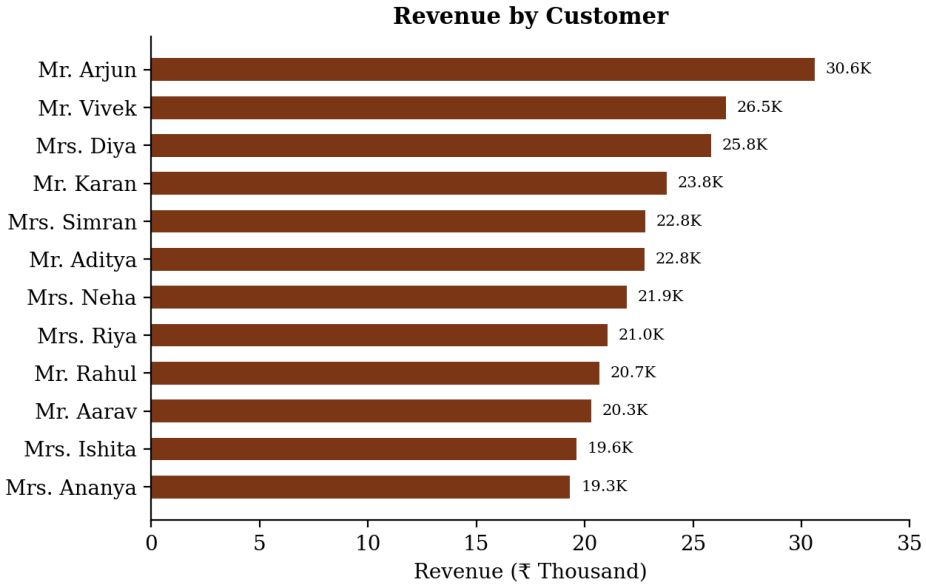

Figure 9. Total revenue by customer (₹ Thousand).

7.1 Observations

Revenue across the twelve customers is fairly tightly clustered — the gap between the top customer and the bottom customer is only around ₹11,300, and ten of the twelve fall within a narrower band of roughly ₹19,000 to ₹26,000. This spread indicates a loyal, broadly balanced customer base rather than dependence on one or two dominant buyers, which is a healthy sign for the stability of TastyTown's revenue. With only twelve customers recorded in total, however, this list more likely represents named regulars than the outlet's complete walk-in customer base, and any loyalty programme built from it should be checked against actual footfall records first.

8. Summary of Key Metrics

Metric	Value
Total order lines (24 months)	1,000
Total units sold	8,162
Total revenue	₹2,75,230
Average order value	₹275.23
Revenue — Fast Food	₹1,88,840 (68.6%)
Revenue — Beverages	₹86,390 (31.4%)
Top single item by revenue	Sandwich — ₹65,820
Top single month by revenue	September 2022 — ₹21,340
Weakest month by revenue	December 2023 — ₹1,380
Cash share of orders	47.6%
Busiest time-of-day slot	Night — ₹62,075
Customers tracked	12
Top customer by revenue	Mr. Arjun — ₹30,620

9. Recommendations & Next Steps

This report answers what has already happened at TastyTown. The following are practical next steps, grounded directly in the patterns found above, that would help the outlet act on these findings and eventually move from a purely descriptive view toward a more forward-looking one.

9.1 Verify the Post-March 2023 Drop

Before drawing any conclusion about declining footfall, the sharp fall in both orders and revenue from April 2023 onward should be reconciled against the outlet's own billing or point-of-sale system, since a change this abrupt and this complete more plausibly reflects a gap in data capture than a genuine collapse in business.

9.2 Protect and Extend the Fast Food Lead

Because Fast Food's advantage over Beverages is driven by demand rather than price, continuing to prioritise stock and counter space for Sandwich, Frankie, and Cold coffee is well justified, while modest combo pricing that pairs a lower-revenue Beverages item with a strong Fast Food seller could help lift Beverages' contribution without discounting the items that are already performing well.

9.3 Close the Payment-Mode Gap

With just over one order in ten currently logged as an Unknown payment type, tightening how payment mode is captured at the point of sale would improve the reliability of future payment-method analysis and make it easier to judge whether incentives are needed to grow Online payment relative to Cash.

9.4 Staff Consistently Across the Day

Since revenue is spread fairly evenly across all five time-of-sale slots, with Night only modestly ahead of Afternoon, staffing levels should stay broadly consistent through the day rather than being concentrated narrowly around a single assumed peak.

9.5 Build on the Loyal Customer Base

Given how evenly revenue is spread across the twelve recorded customers, a simple loyalty or repeat-visit reward aimed at this whole group, rather than just the top one or two names, is likely to reinforce a pattern of return business that already appears to exist.

9.6 Next Steps to Move From Descriptive Toward Predictive

- Demand forecasting by item and time slot to guide prep quantities and reduce wastage
- Anomaly detection on sudden order-count drops, which would have flagged the April 2023 change automatically
- Repeat-purchase and loyalty analysis once a larger, ongoing customer base is captured, not just the twelve names currently on file

None of these require new infrastructure beyond what already produced this report — they simply need a longer run of consistently captured transaction data, ideally with the payment-mode and date-logging gaps identified above closed first.

10. Appendix

10.1 Full Category Breakdown

Category	Orders	Units Sold	Revenue (₹)	Revenue Share
Fast Food	686	5,523	1,88,840	68.6%
Beverages	314	2,639	86,390	31.4%

10.2 Full Product-Level Table

Item	Category	Unit Price (₹)	Orders	Units Sold	Revenue (₹)
Sandwich	Fast Food	60	129	1,097	65,820
Frankie	Fast Food	50	139	1,150	57,500
Cold coffee	Beverages	40	161	1,361	54,440
Sugarcane juice	Beverages	25	153	1,278	31,950
Panipuri	Fast Food	20	150	1,226	24,520
Aalopuri	Fast Food	20	134	1,044	20,880
Vadapav	Fast Food	20	134	1,006	20,120

10.3 Full Monthly Revenue Table

Month	Orders	Revenue (₹)
Jan 2022	21	5,785
Feb 2022	27	8,010
Mar 2022	23	4,720
Apr 2022	65	17,610
May 2022	84	21,155
Jun 2022	66	16,670
Jul 2022	66	17,420
Aug 2022	85	21,285
Sep 2022	82	21,340
Oct 2022	76	19,240
Nov 2022	71	21,200
Dec 2022	80	21,140
Jan 2023	62	19,680
Feb 2023	55	17,510
Mar 2023	62	20,400
Apr 2023	9	3,450
May 2023	16	5,015
Jun 2023	8	2,490
Jul 2023	9	2,030
Aug 2023	5	1,680
Sep 2023	7	2,530
Oct 2023	8	1,955
Nov 2023	9	1,535
Dec 2023	4	1,380

10.4 Full Payment Method Breakdown

Payment Mode	Orders	Revenue (₹)
Cash	476	1,32,840
Online	417	1,10,595
Unknown	107	31,795

10.5 Full Time-of-Sale Breakdown

Time Slot	Orders	Revenue (₹)
Night	205	62,075
Afternoon	205	56,345
Morning	190	53,730
Evening	201	52,355
Midnight	199	50,725

10.6 Full Customer-Level Table

Customer	Orders	Units Purchased	Revenue (₹)
Mr. Arjun	101	814	30,620
Mr. Vivek	87	725	26,510
Mrs. Diya	89	769	25,845
Mr. Karan	85	710	23,795
Mrs. Simran	88	727	22,810
Mr. Aditya	90	752	22,770
Mrs. Neha	80	597	21,935
Mrs. Riya	85	658	21,040
Mr. Rahul	75	630	20,675
Mr. Aarav	76	623	20,290
Mrs. Ishita	73	594	19,610
Mrs. Ananya	71	563	19,330
